

CSc 352

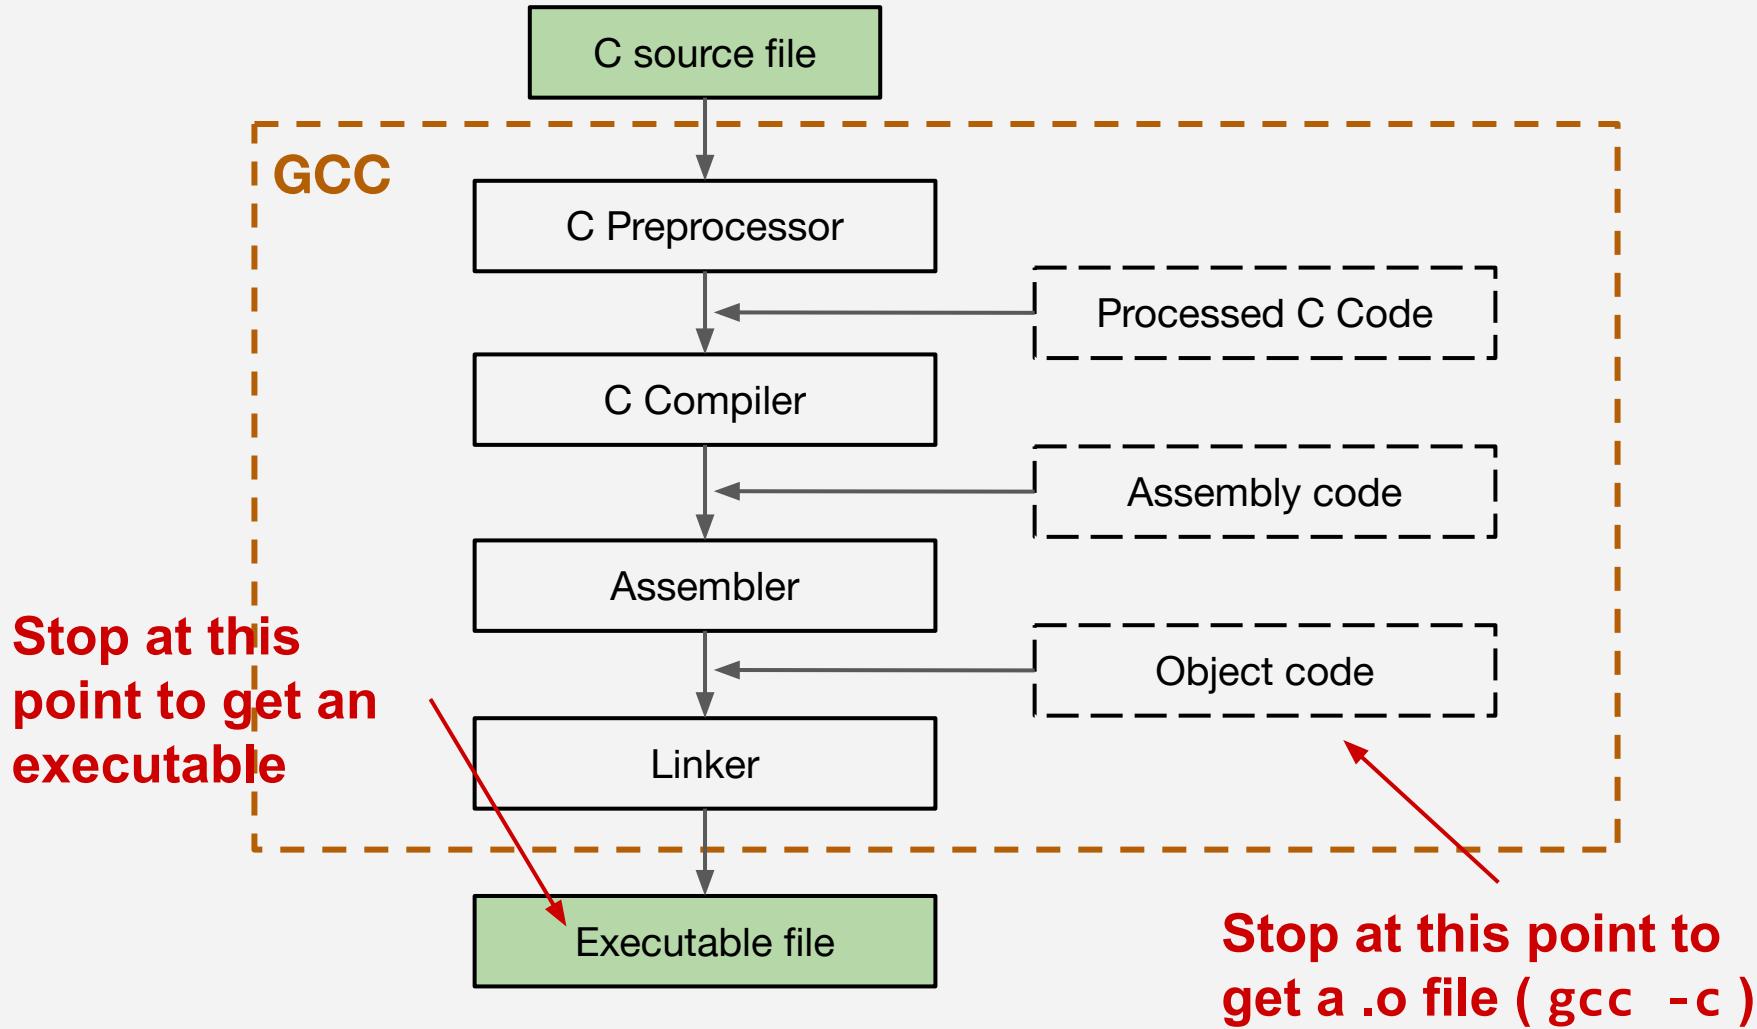

Compilation, ELF

Benjamin Dicken

Compiling to Bytecode

- When we compile a program with GCC, the eventual goal is to get binary, executable, linked code
 - Either executable, or object file (to be linked with other code)

Going through the steps

```
$ cpp test.c -E -o /tmp/test.i  
$ gcc /tmp/test.i -S -o /tmp/test.s  
$ as /tmp/test.s -o /tmp/test.o  
$ ld /tmp/test.o  
$ objdump -D -t /tmp/test.o > /tmp/test.d  
$ # gcc -v test.c should help
```

https://medium.com/@kunal_jaydesai/understanding-linking-8709e2cc450e

<https://medium.com/swlh/deep-dive-into-static-linking-c3b1f459c99d>

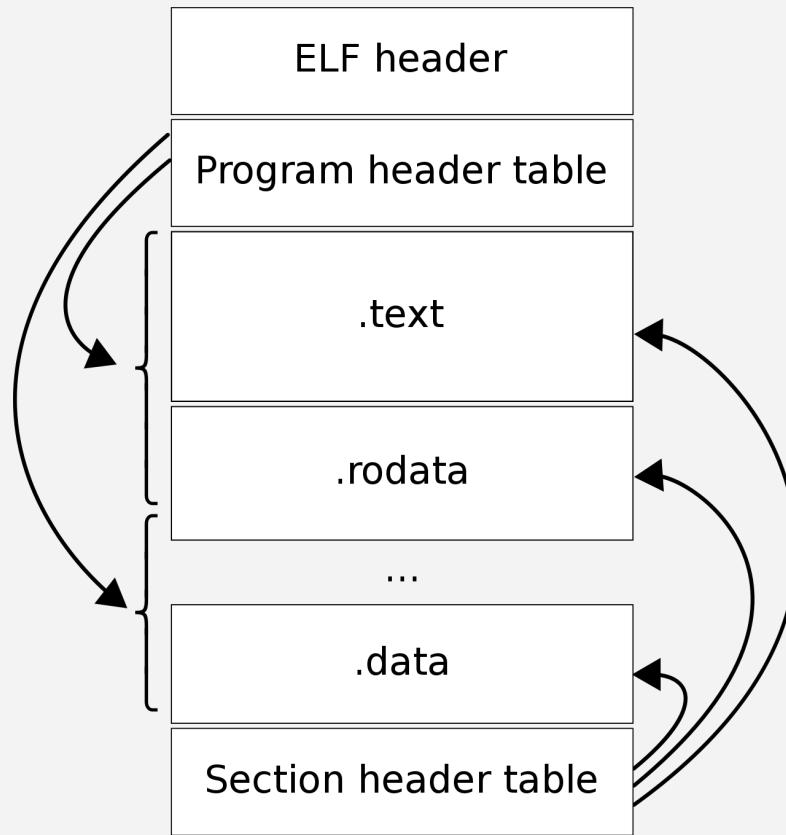

Going through the steps

```
ld -plugin /usr/lib/gcc/x86_64-linux-gnu/9/liblto_plugin.so
-plugin-opt=/usr/lib/gcc/x86_64-linux-gnu/9/lto-wrapper -plugin-opt=-fresolution=/tmp/cc4CKbXW.res
-plugin-opt=-pass-through=-lgcc -plugin-opt=-pass-through=-lgcc_s -plugin-opt=-pass-through=-lc
-plugin-opt=-pass-through=-lgcc -plugin-opt=-pass-through=-lgcc_s --build-id --eh-frame-hdr -m elf_x86_64
--hash-style=gnu --as-needed -dynamic-linker /lib64/ld-linux-x86-64.so.2 -pie -z now -z relro
/usr/lib/gcc/x86_64-linux-gnu/9/../../../../../x86_64-linux-gnu/Scrt1.o
/usr/lib/gcc/x86_64-linux-gnu/9/../../../../../x86_64-linux-gnu/crti.o /usr/lib/gcc/x86_64-linux-gnu/9/crtbeginS.o
-L/usr/lib/gcc/x86_64-linux-gnu/9 -L/usr/lib/gcc/x86_64-linux-gnu/9/../../../../../x86_64-linux-gnu
-L/usr/lib/gcc/x86_64-linux-gnu/9/../../../../../lib -L/lib/x86_64-linux-gnu -L/lib/../lib
-L/usr/lib/x86_64-linux-gnu -L/usr/lib/../lib -L/usr/lib/gcc/x86_64-linux-gnu/9/../../../../../ /tmp/test.o
-lgcc --push-state --as-needed -lgcc_s --pop-state -lc -lgcc --push-state --as-needed -lgcc_s --pop-state
/usr/lib/gcc/x86_64-linux-gnu/9/crtnS.o /usr/lib/gcc/x86_64-linux-gnu/9/../../../../../x86_64-linux-gnu/crtn.o
```

ELF

- Executable and Linkable Format (ELF) is the standard format used for executable files and object files on UNIX systems
- The ELF format specifies where various parts of the program go (the code, the constants, the symbol table, etc)
- Remember: Files are just a bunch of 1s and 0s - We can choose how to interpret these files!

https://en.wikipedia.org/wiki/Executable_and_Linkable_Format

Reading ELF Files

- `objdump -s` Display full contents in hex
- `objdump -d -S -h` Display disassembled code, w/ source, headers
- `readelf -h` Display the header info
- `readelf -a` Display all the info

```
#include <stdio.h>
#include <string.h>
#include <stdlib.h>

const int abc = 100;
const char name[] = "Incredible";

int main(int argc, char* argv[]) {
    printf("hi\n");
    printf("hi");
    printf("abc: %d\n", abc);
    printf("name: %s\n", name);

    int length1 = strlen(name);
    printf("length1: %d\n", length1);

    char * x = malloc(150);
    int length2 = strlen(x);
    printf("length2: %d\n", length2);

    return 0;
}
```

Explore with this file

/tmp/test.c

```
#include <stdio.h>
#include <string.h>
#include <stdlib.h>

const int abc = 100;
const char name[] = "Incredible";

int main(int argc, char* argv[]) {
    printf("hi\n");
    printf("hi");
    printf("abc: %d\n", abc);
    printf("name: %s\n", name);

    int length1 = strlen(name);
    printf("length1: %d\n", length1);

    char * x = malloc(150);
    int length2 = strlen(x);
    printf("length2: %d\n", length2);

    return 0;
}
```

Explore

- (1) Compile (with -g)
- (2) \$ objdump -d -S -h a.out
- (3) Investigate main
- (4) How many calls to printf, puts, strlen do you see.
- (5) Why?

From output of objdump

Why puts here?

```
int main(int argc, char* argv[]) {  
    11a9: f3 0f 1e fa        endbr64  
    11ad: 55                push   %rbp  
    11ae: 48 89 e5          mov    %rsp,%rbp  
    11b1: 48 83 ec 20       sub    $0x20,%rsp  
    11b5: 89 7d ec          mov    %edi,-0x14(%rbp)  
    11b8: 48 89 75 e0       mov    %rsi,-0x20(%rbp)  
    printf("hi\n");  
    11bc: 48 8d 3d 58 0e 00 00  lea    0xe58(%rip),%rdi      # 201b <name+0xb>  
    11c3: e8 b8 fe ff ff    callq  1080 <puts@plt>  
    printf("hi");  
    11c8: 48 8d 3d 4c 0e 00 00  lea    0xe4c(%rip),%rdi      # 201b <name+0xb>  
    11cf: b8 00 00 00 00       mov    $0x0,%eax  
    11d4: e8 c7 fe ff ff    callq  10a0 <printf@plt>  
    . . .
```

And then printf here?

From output of objdump

```
int length1 = strlen(name);
1209: c7 45 f0 0a 00 00 00  movl  $0xa,-0x10(%rbp)
printf("length1: %d\n", length1);
1210: 8b 45 f0          mov    -0x10(%rbp),%eax
1213: 89 c6          mov    %eax,%esi
1215: 48 8d 3d 15 0e 00 00  lea    0xe15(%rip),%rdi      # 2031 <name+0x21>
121c: b8 00 00 00 00      mov    $0x0,%eax
1221: e8 7a fe ff ff      callq 10a0 <printf@plt>

char * x = malloc(150);
1226: bf 96 00 00 00      mov    $0x96,%edi
122b: e8 80 fe ff ff      callq 10b0 <malloc@plt>
1230: 48 89 45 f8          mov    %rax,-0x8(%rbp)
int length2 = strlen(x);
1234: 48 8b 45 f8          mov    -0x8(%rbp),%rax
1238: 48 89 c7          mov    %rax,%rdi
123b: e8 50 fe ff ff      callq 1090 <strlen@plt>
1240: 89 45 f4          mov    %eax,-0xc(%rbp)
. . .
```

Why no strlen call here?

But there is here?

Compare and Contrast

Take the test program and compile in two ways:

```
$ gcc -Wall -Werror -std=c11 -g test.c -o dynamic  
$ gcc -static -Wall -Werror -std=c11 -g test.c -o static
```

What is the difference?

Investigate with **objdump** and **readelf**

```
#include <stdio.h>  
  
int main() {  
    printf("sup\n");  
    return 0;  
}
```

Compare and Contrast

Take the test program and compile in two ways:

```
$ gcc -Wall -Werror -std=c11 -g test.c -o dynamiccg  
$ gcc -Wall -Werror -std=c11 test.c -o dynamic
```

What is the difference?

Investigate with **objdump** and **readelf**

```
#include <stdio.h>  
  
int main() {  
    printf("sup\n");  
    return 0;  
}
```

Compare and Contrast

Take the test program and compile in two ways:

```
$ gcc -Wall -Werror -std=c11 -c test.c -o dynamic.o  
$ gcc -Wall -Werror -std=c11 test.c -o dynamic
```

What is the difference?

Investigate with **objdump** and **readelf**

```
#include <stdio.h>  
  
int main() {  
    printf("sup\n");  
    return 0;  
}
```

Linking

- In the **linking** step, combining code from multiple ELF files together (If needed)
- Can link from other .o file that are a part of your project
- Can also link to other shared object files, such as the standard library

Static and Dynamic Linking

- In **Static Linking** the code from the file being linked together is actually included in the executable (larger file size)
- With **Dynamic linking**, the other symbols (functions, data) are dynamically linked at **runtime**
